TiTiler

What?

Why?

How?

Ti...

Ping Me!

What?

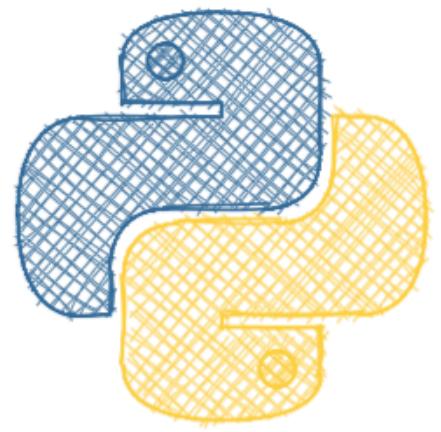

TiTiler

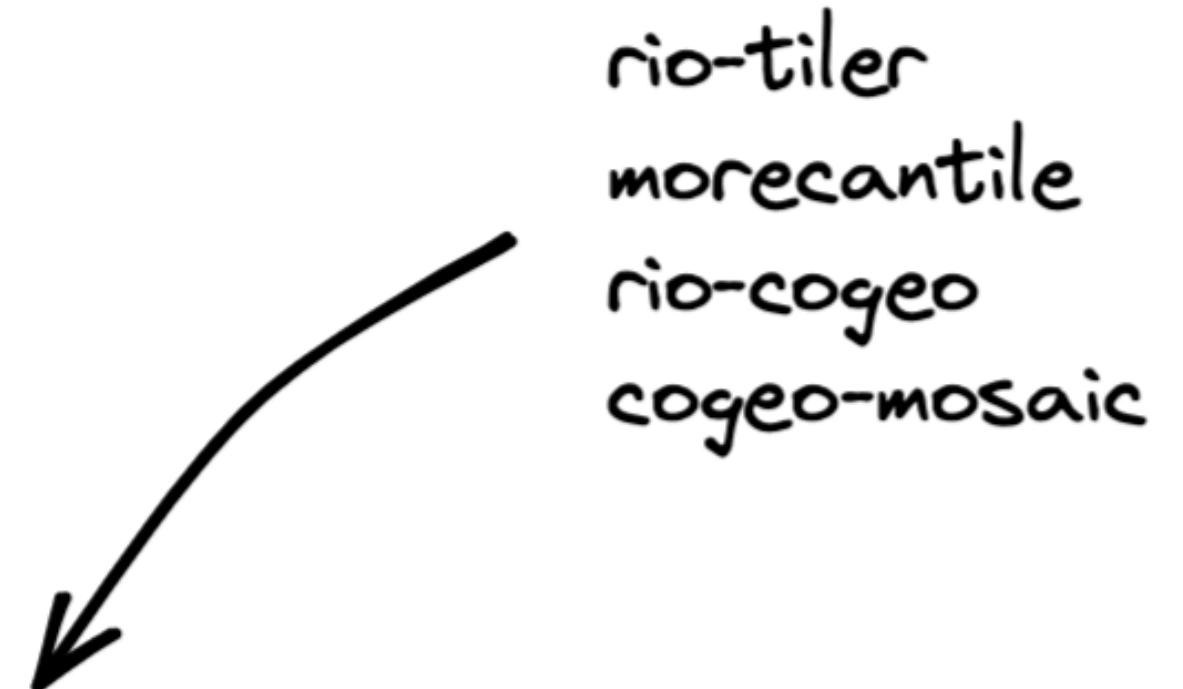

<https://developmentseed.org/titiler/>

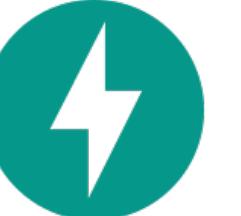

What?

Python >=3.7

Rasterio / GDAL / PyProj

 **FastAPI**

What?

- Production ready (Built on top of FastAPI)
- Cloud Optimized GeoTIFF support (and all Raster supported by GDAL)
- SpatioTemporal Asset Catalog (STAC) support
- Multiple projections (TileMatrixSets) support via morecantile.
- JPEG / JP2 / PNG / WEBP / GTIFF / NumpyTile output format support
- OGC WMTS support
- Full OpenAPI documentation
- Virtual mosaic support (via MosaicJSON)
- Extensible / Customizable

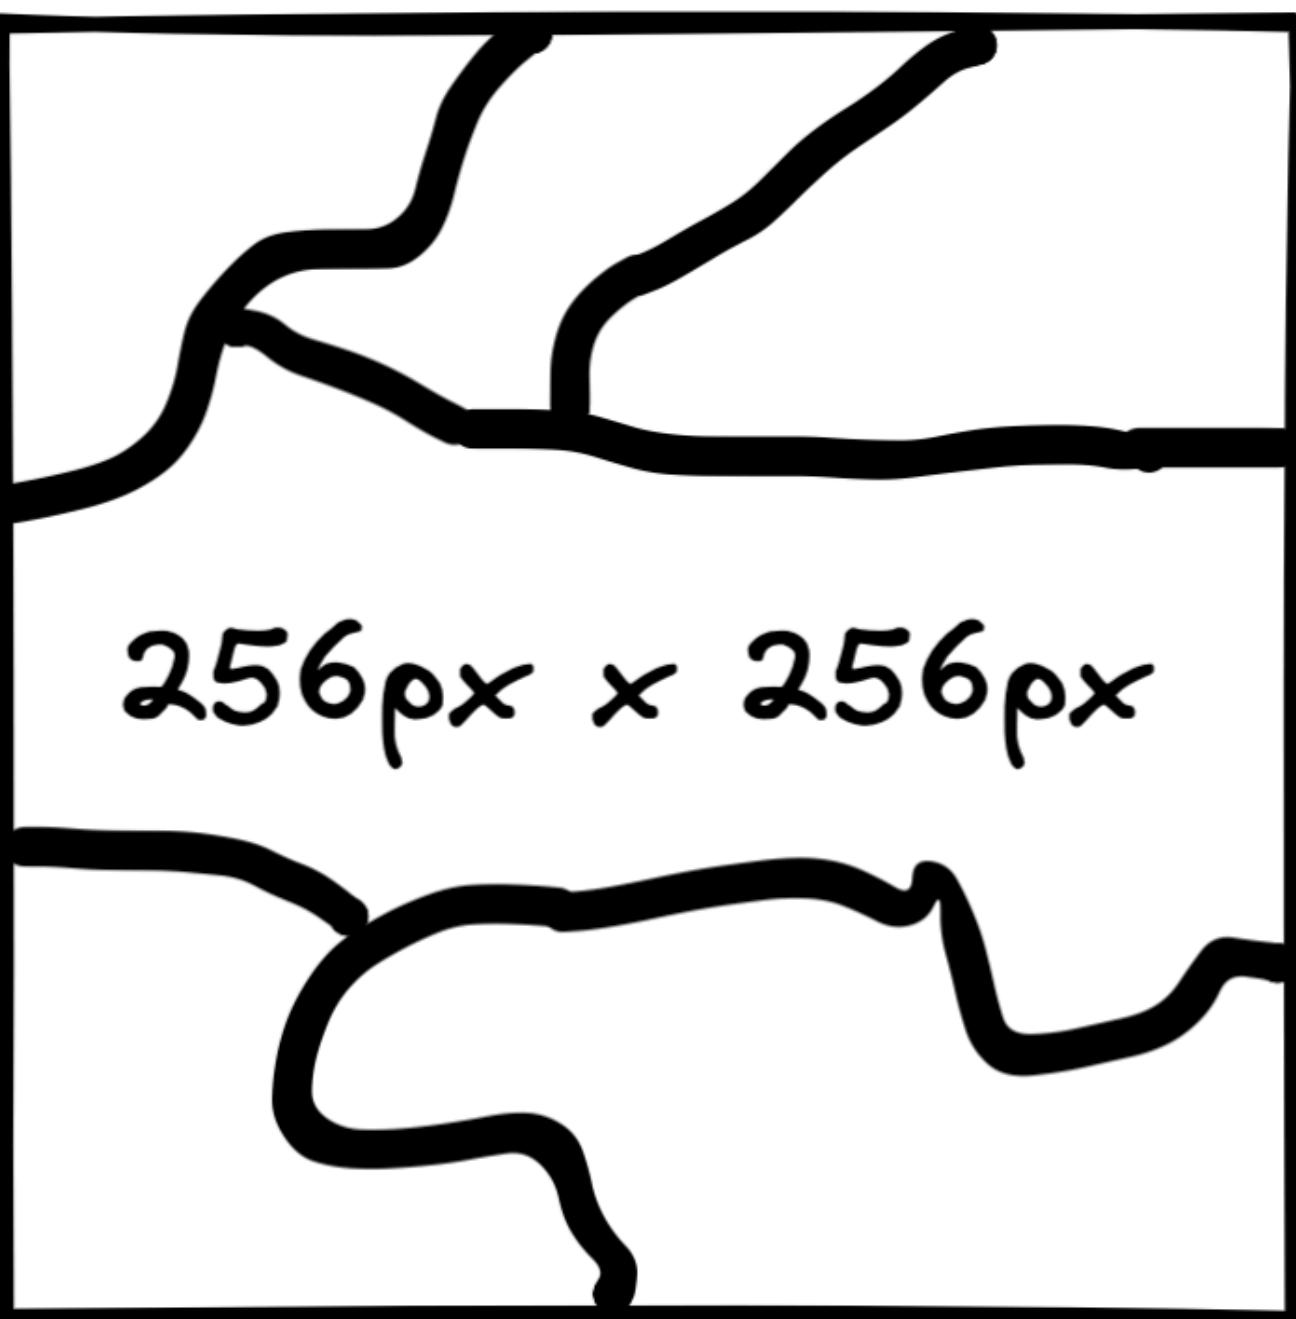

What?

Maps

What?

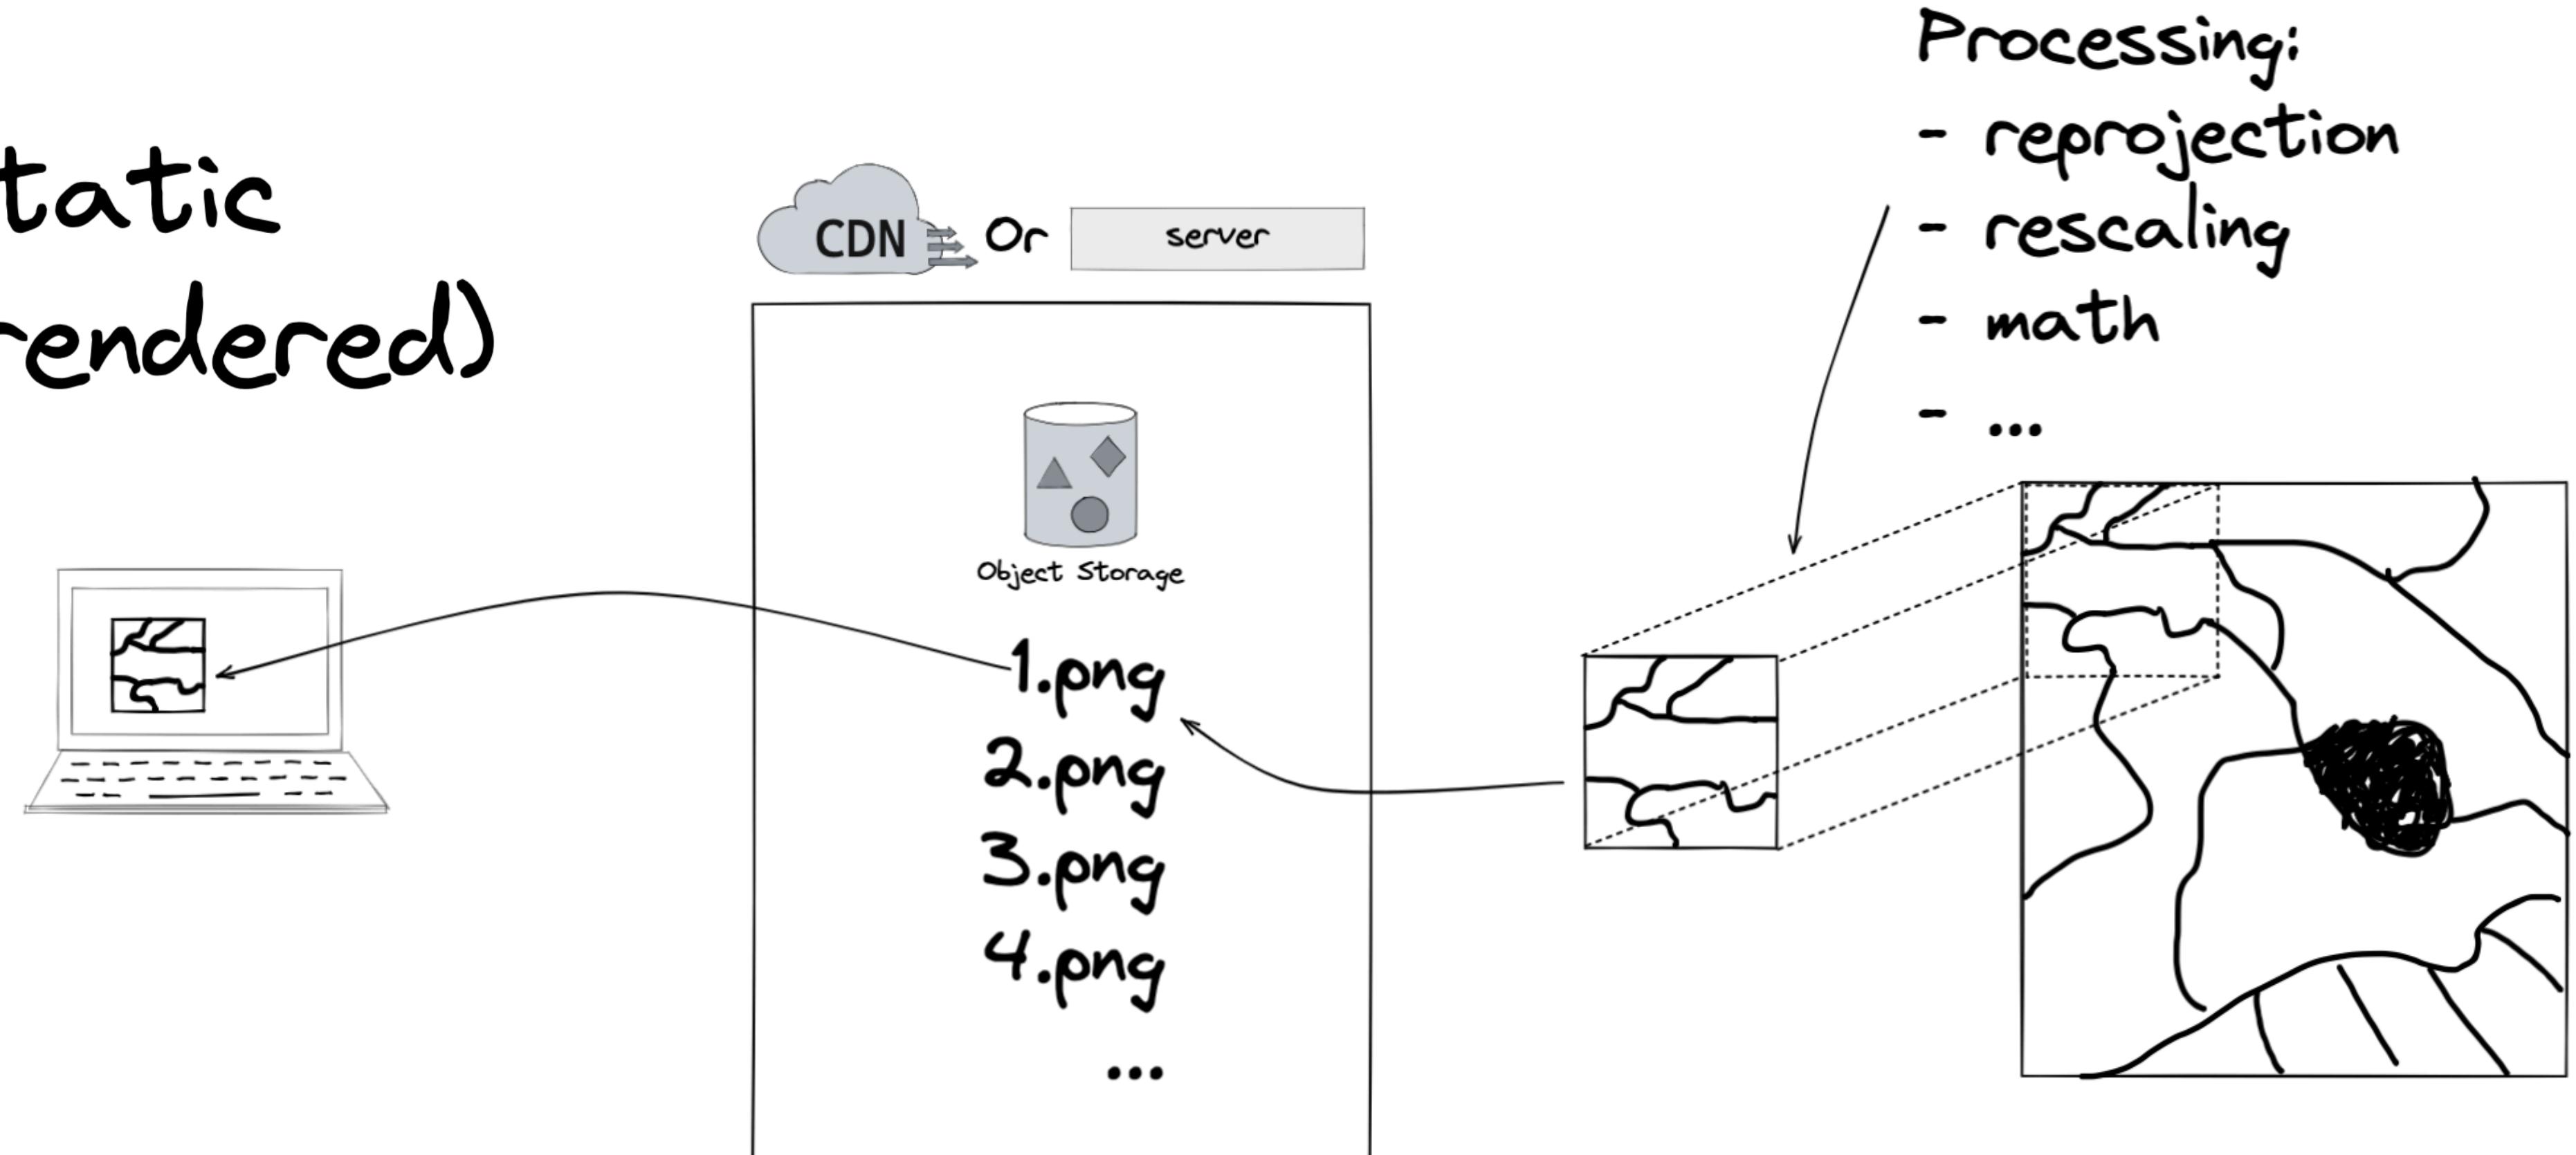

# Map Tile (raster)

PNG  
JPEG  
WEBP

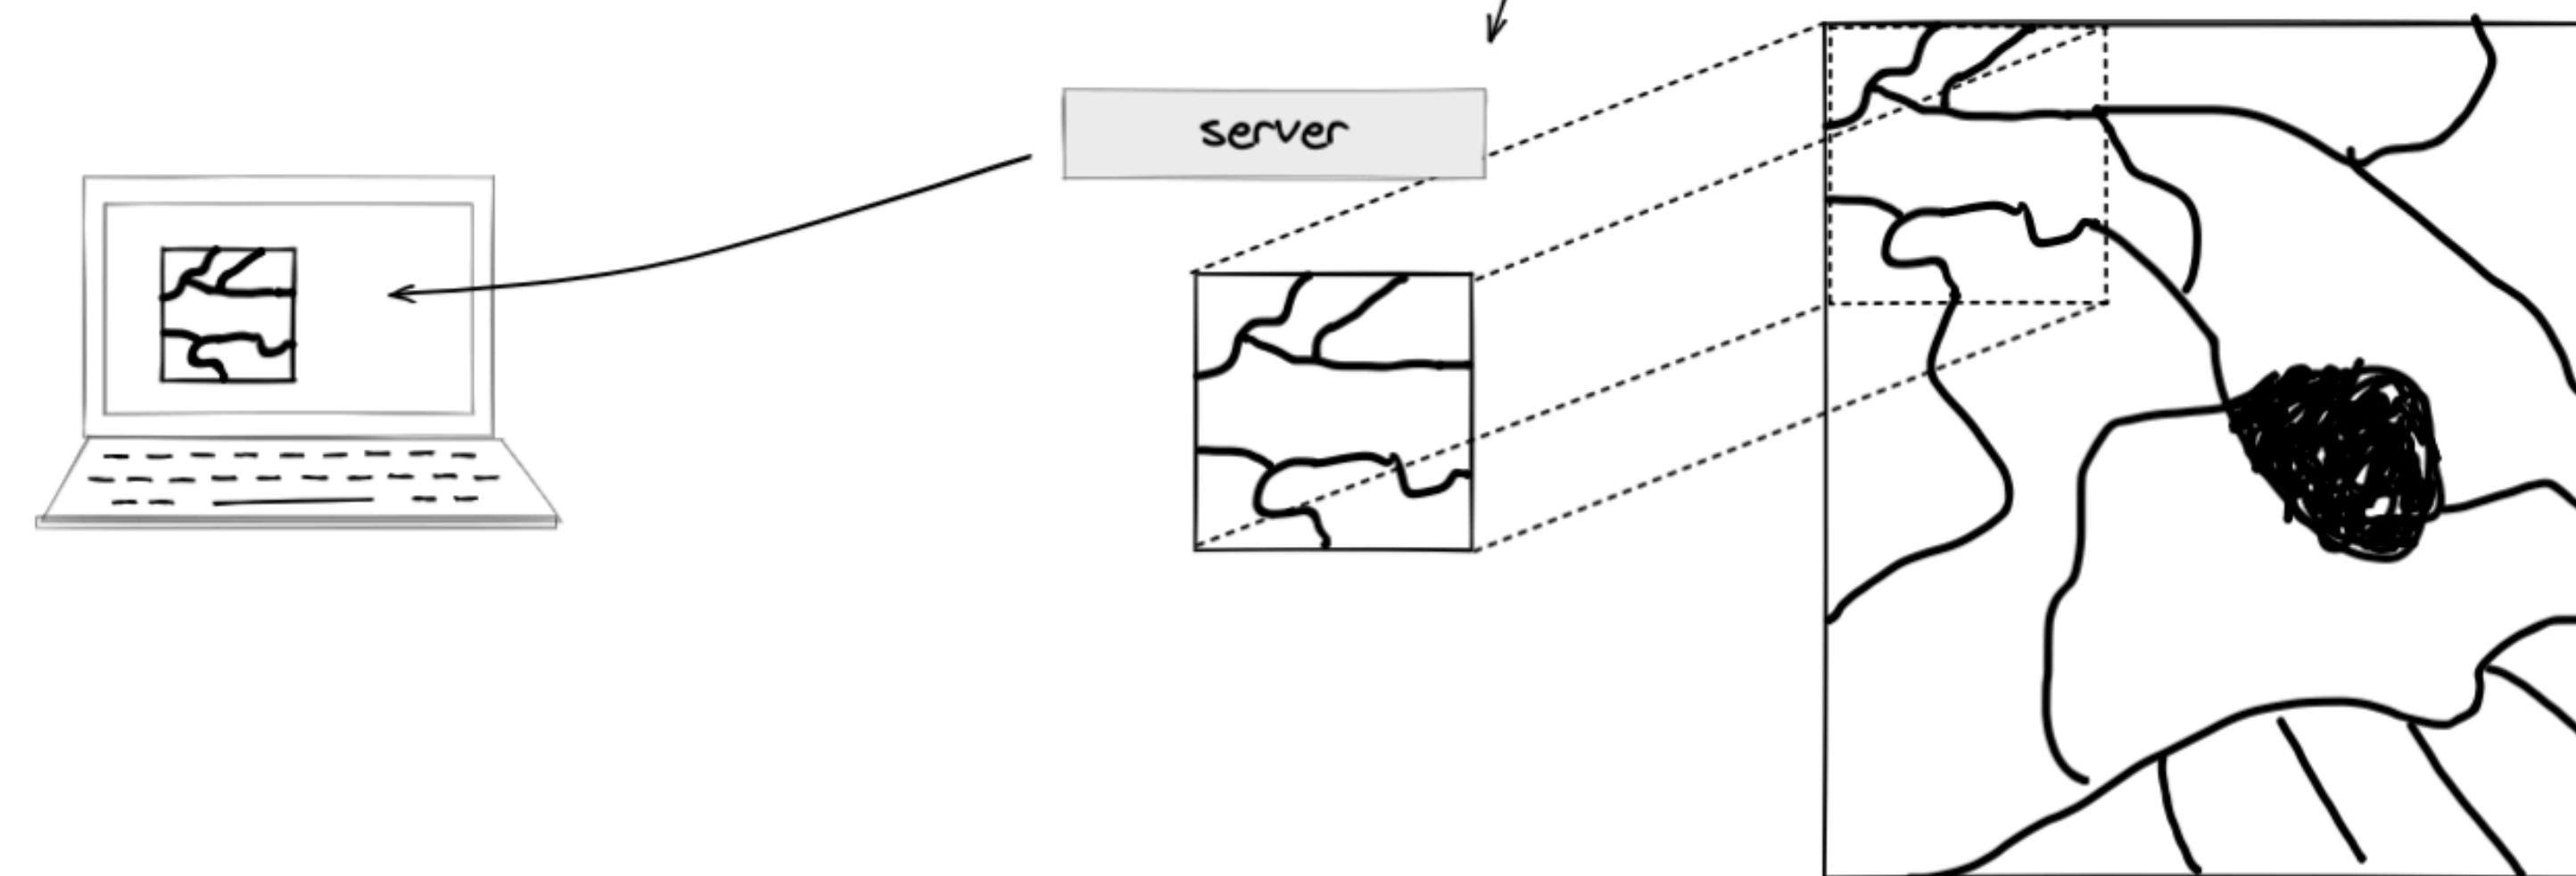

Why?

# Static (pre-rendered)

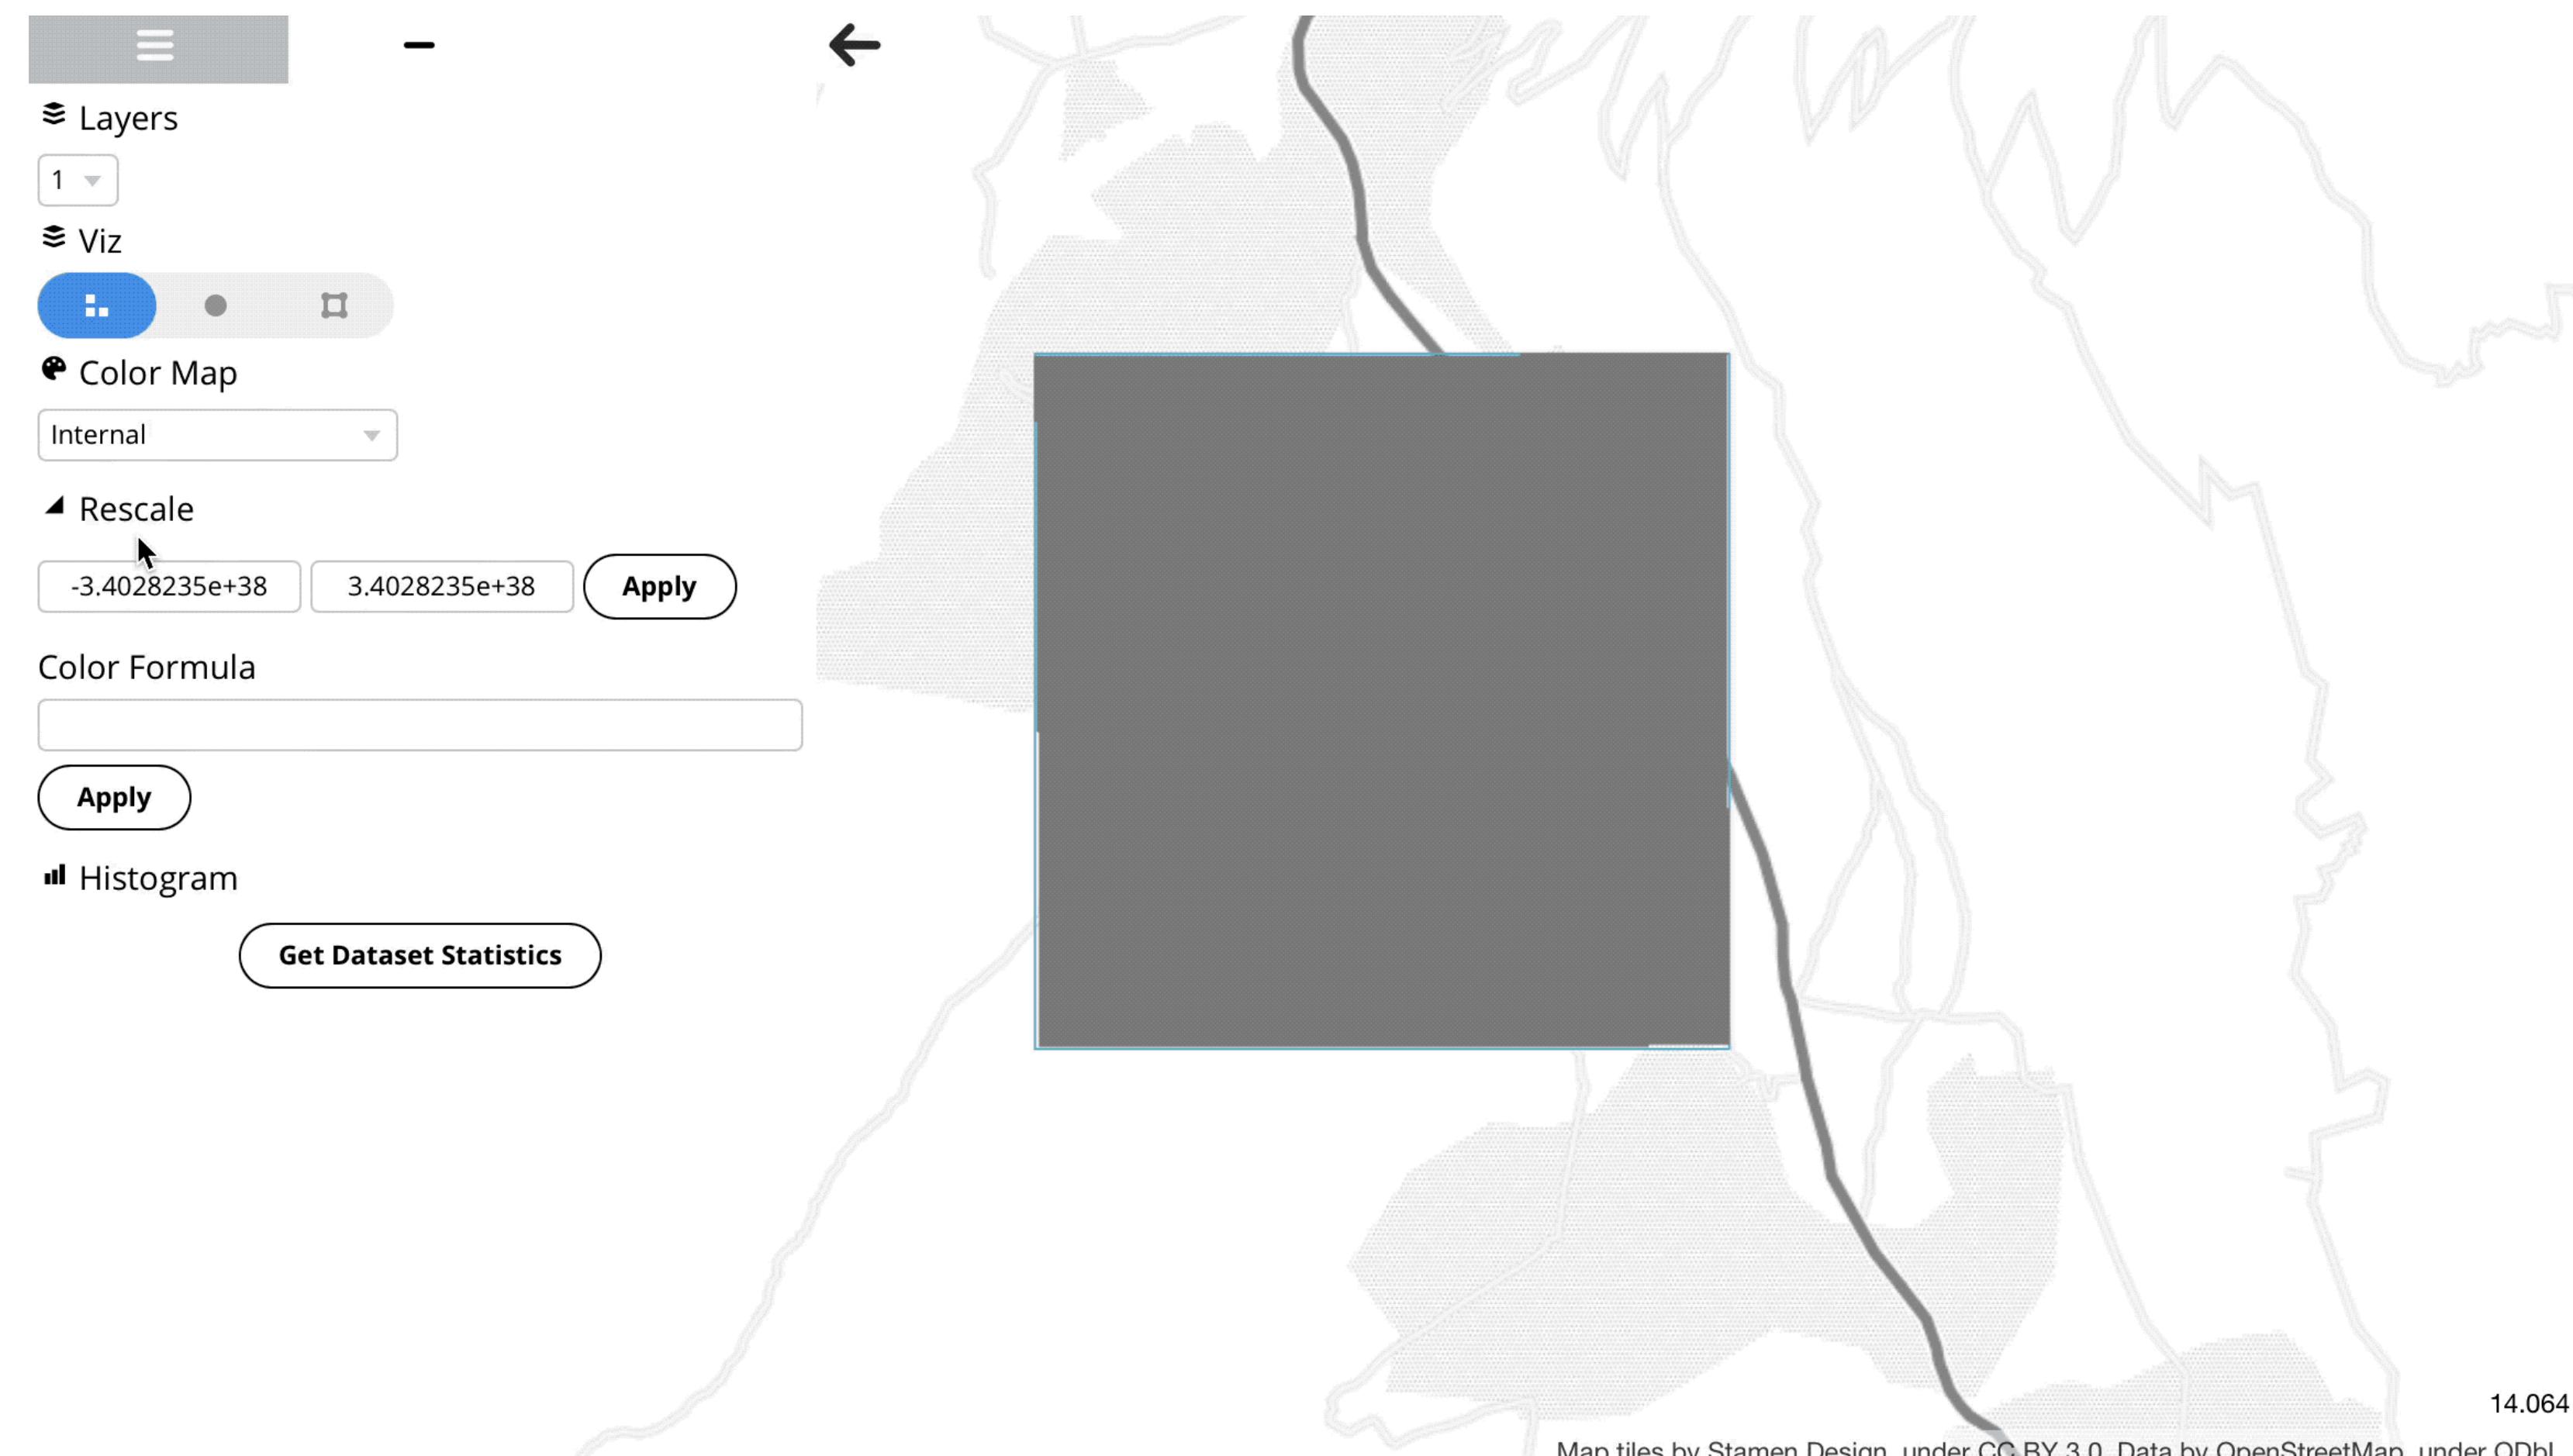

Why?

# Dynamic (rendering on-demand)

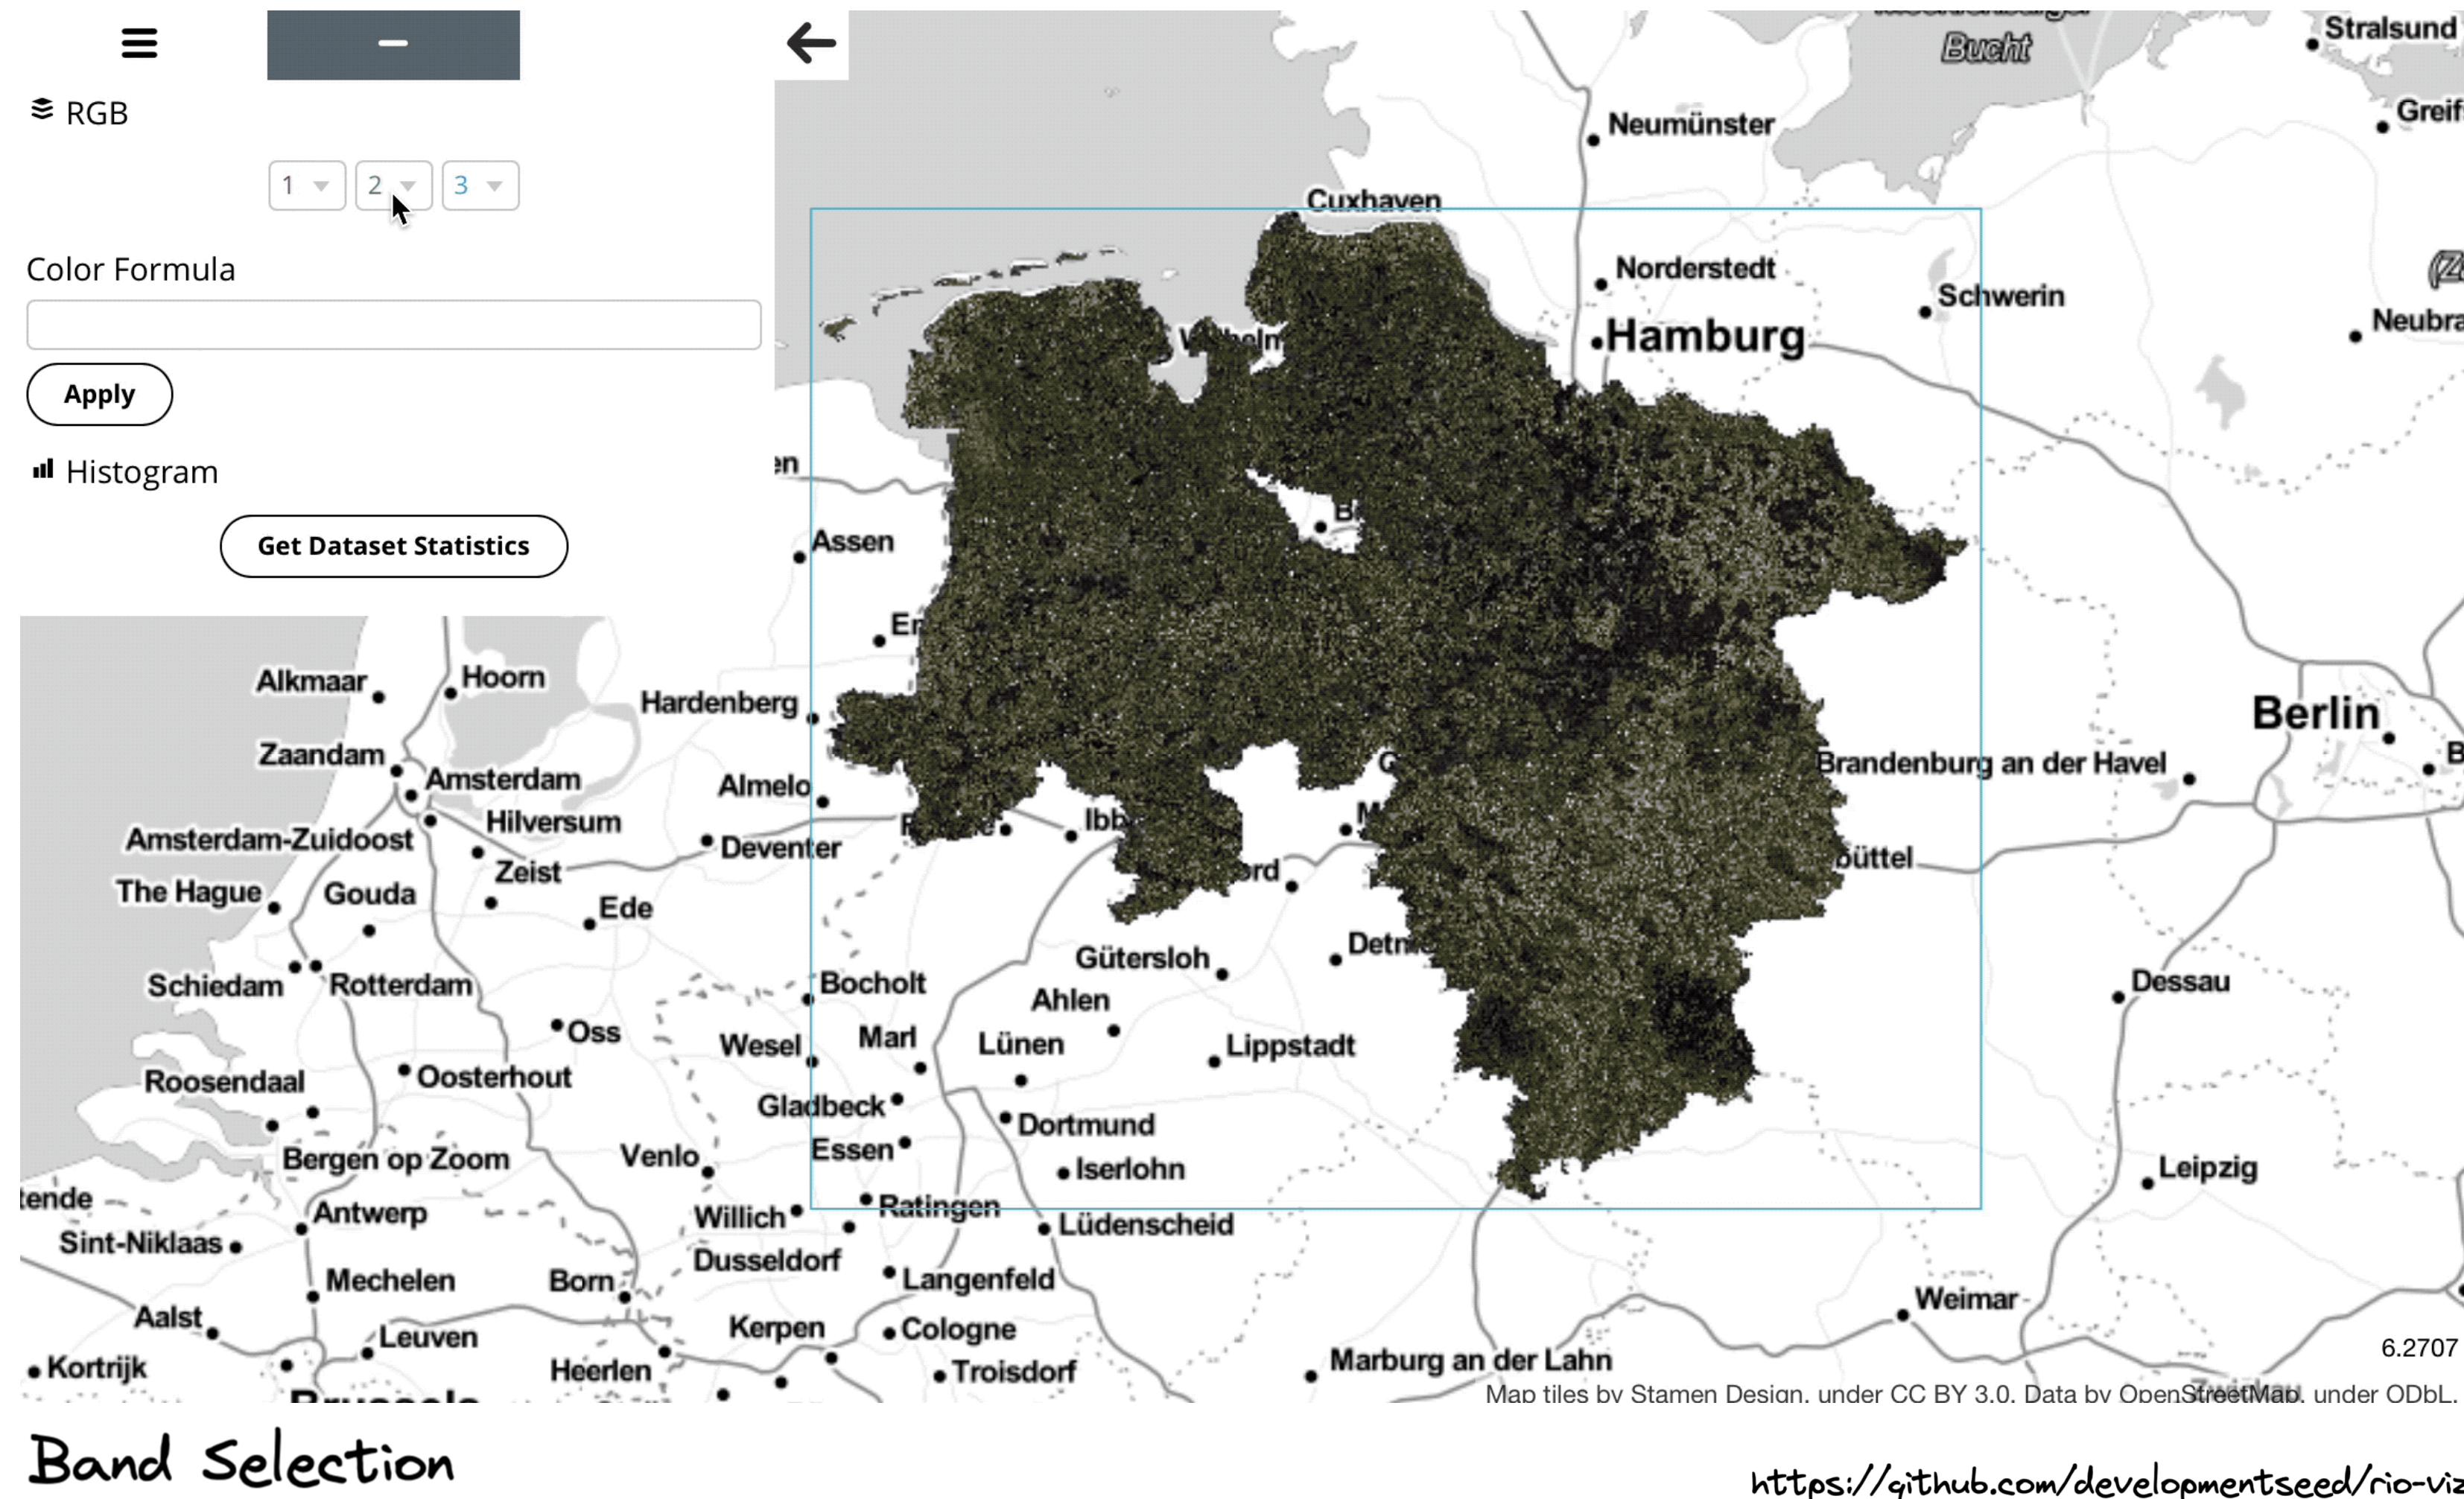

Why?

Rescaling and Colormap

<https://github.com/developmentseed/rio-viz>

Why?

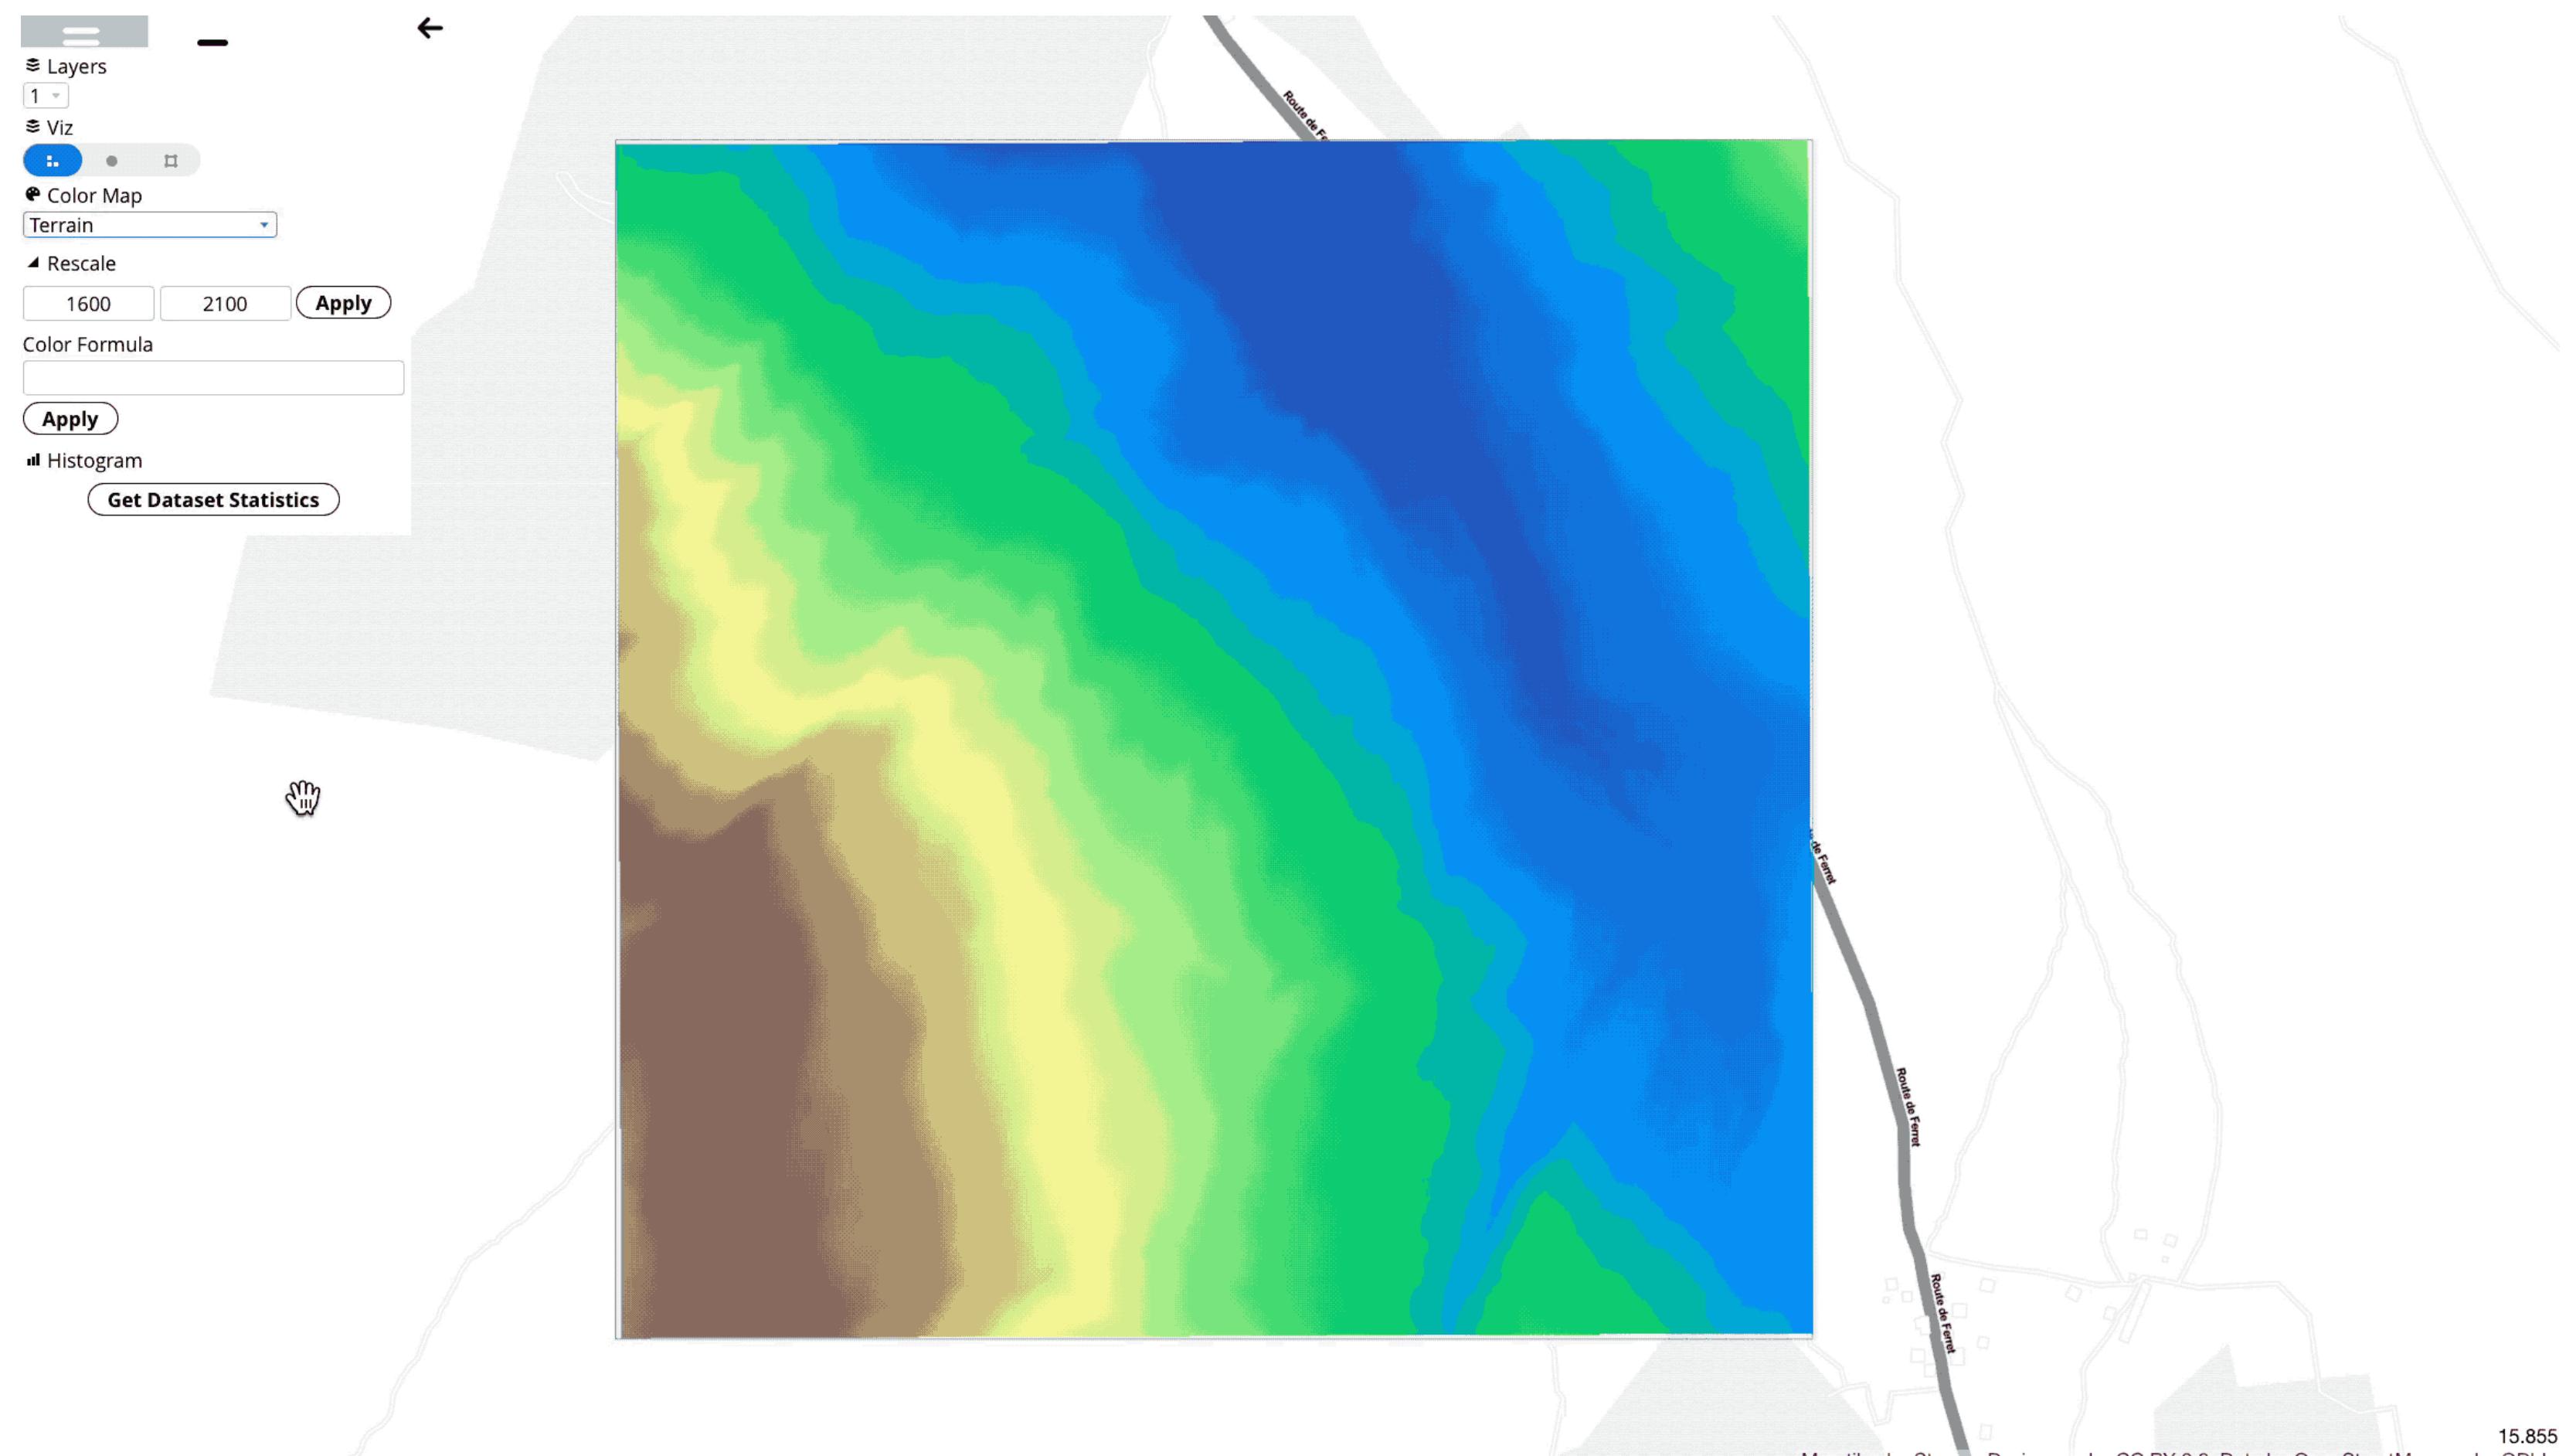

Why?

## Mosaic

<https://github.com/developmentseed/rio-viz>

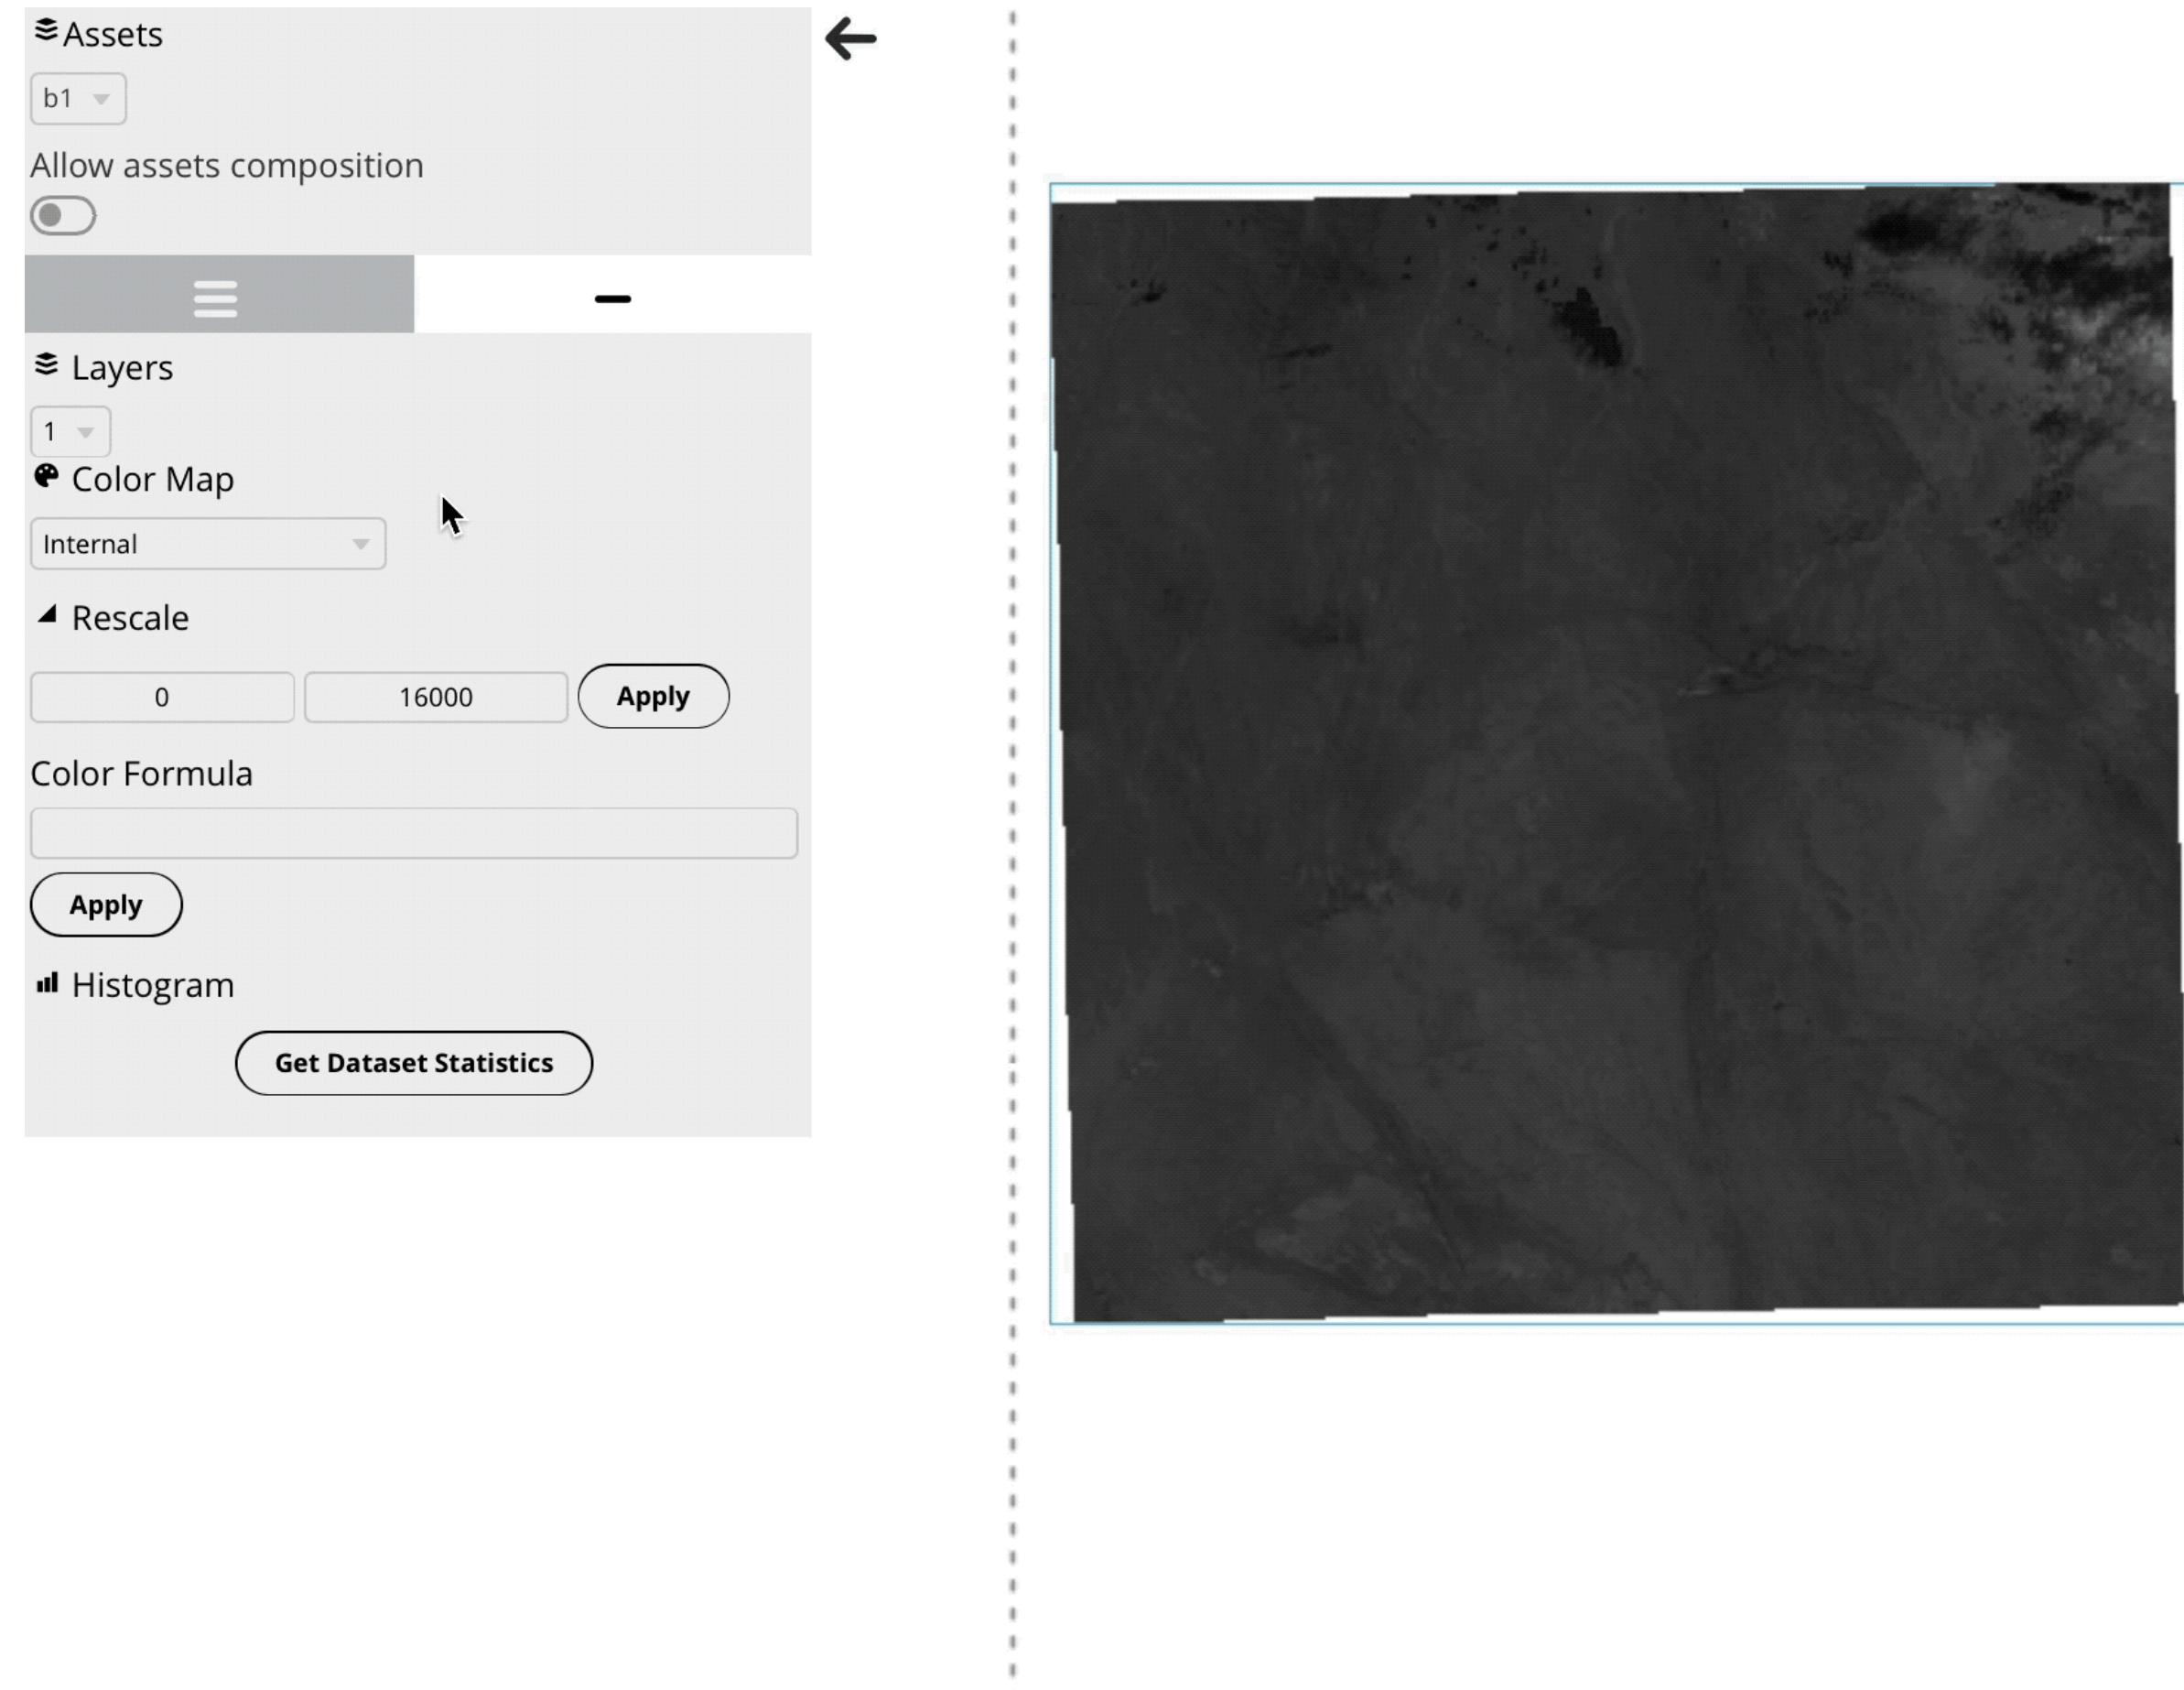

Why?

Pixel to Vector

<https://github.com/developmentseed/rio-viz>

# Why?

Fusion

<https://github.com/developmentseed/rio-viz>

How?

Don't fork it, Import it!

pip install titiler.core

More:

```
pip install titiler.mosaic # add Mosaic support  
pip install titiler.application # Demo app  
pip install titiler.pgstac # Dynamic Mosaic with PgSTAC
```

# How?

## Simple custom application

```
import uvicorn
from fastapi import FastAPI
from titiler.core.factory import TilerFactory

# Create a FastAPI application
app = FastAPI()

# Create a TiTiler service endpoints (tiles, crop, info...)
cog = TilerFactory()

# Register the endpoints in the application
app.include_router(cog.router)

if __name__ == "__main__":
    uvicorn.run(app=app, host="0.0.0.0", port=8080)
```

## FastAPI 0.1.0 OAS3

/openapi.json

### default

GET	/WMSCapabilities.xml	Wmts
GET	/point/{lon},{lat}	Point
GET	/preview.{format}	Preview
GET	/preview	Preview
GET	/crop/{minx},{miny},{maxx},{maxy}/{width}x{height}.{format}	Part
GET	/crop/{minx},{miny},{maxx},{maxy}.@{format}	Part
POST	/crop/{width}x{height}.{format}	Geojson Crop
POST	/crop.{format}	Geojson Crop
POST	/crop	Geojson Crop

How?

## Simple custom application

```
import uvicorn
from fastapi import FastAPI
from titiler.core.factory import TilerFactory

# Create a FastAPI application
app = FastAPI()

# Create a TiTiler service endpoints (tiles, crop, info...)
cog = TilerFactory()

# Register the endpoints in the application
app.include_router(cog.router)

if __name__ == "__main__":
    uvicorn.run(app=app, host="0.0.0.0", port=8080)
```

TiTiler's Factories are helper classes which build and register endpoint to a FastAPI router

rescale=0,1  
colormap\_name=viridis

How?

Don't fork it, Import it!

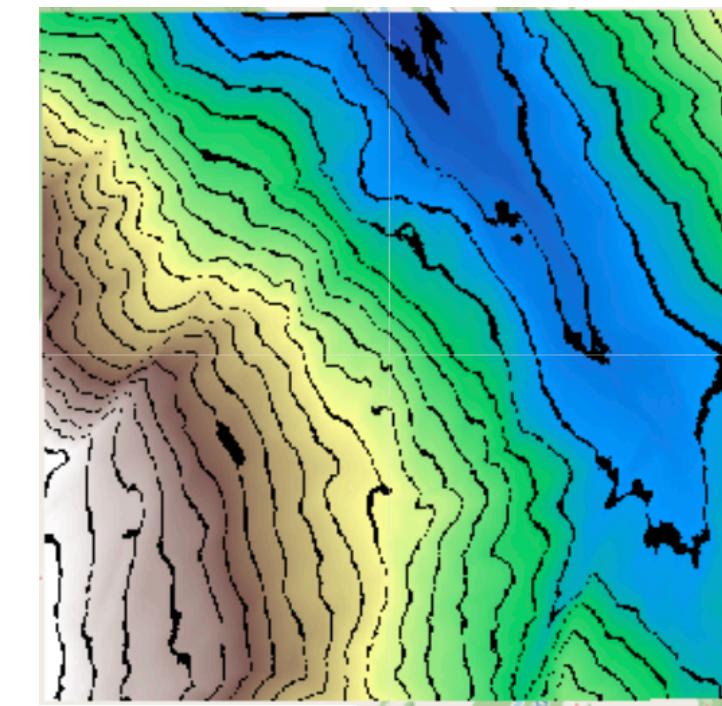

Next

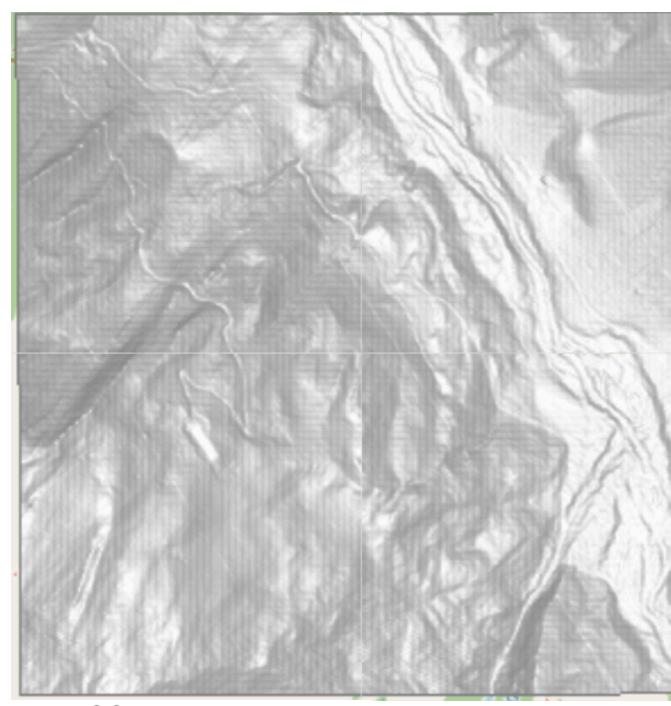

- rio-tiler V4 (Speed)
- enable complex post-process (e.g Shaded Relief)
- focus on user customization
- more documentation
- Zarr support
- Non Geo Data

# TiTiler

Not Just a Tile Server

It's a Python module

It makes tiles from Cloud Optimized Dataset

You can customize/extend it

It's production ready (🙏 FastAPI)

It supports Mosaic and STAC

Preview / Crop / Points / Metadata

It's OPEN SOURCE

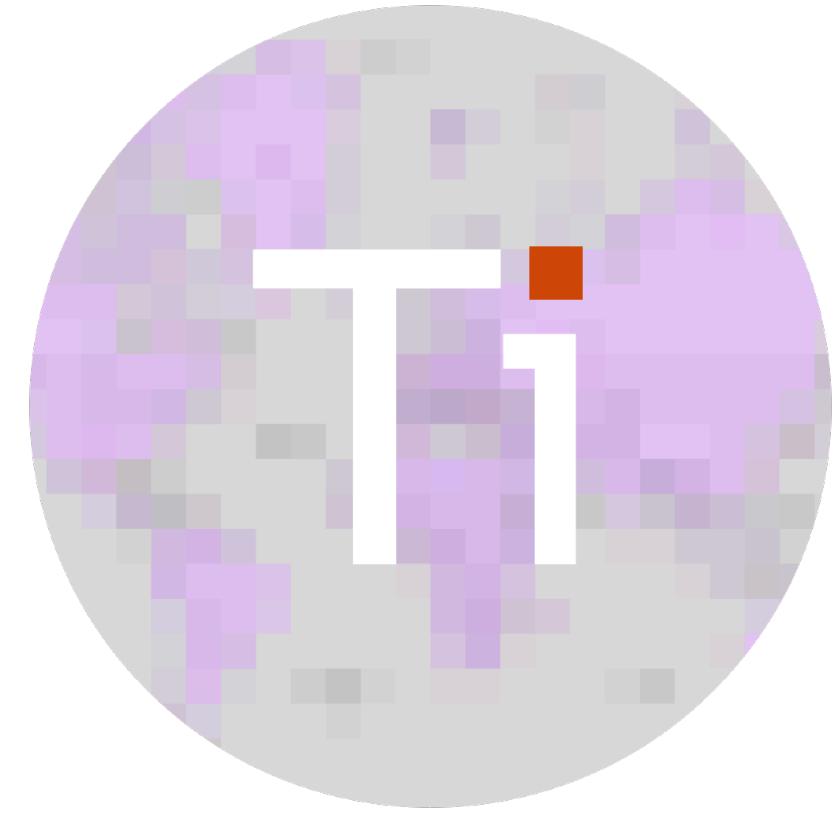

Ti...

python/FastAPI for everything!
